

2008 Louisiana Annual Network Assessment

**Louisiana Department of Environmental Quality
Office of Environmental Assessment
Air Quality Assessment Division**

May 30, 2008

The Louisiana Department of Environmental Quality's (LDEQ) Air Analysis section has operated State and Local Ambient Monitoring Stations (SLAMS), Photochemical Assessment Monitoring Stations (PAMS), Special Purpose Monitoring Stations (SPMS), and a proposed National Core Network (NCore) Ambient Air Monitoring Station as a requirement of the Code of Federal Regulations (CFR), Title 40, Part 58. These stations measure ambient air concentrations of those pollutants for which standards have been established in 40 CFR Part 50. Data acquired from the stations are submitted into the EPA's Air Quality System (AQS) where it is judged against the National Ambient Air Quality Standards (NAAQS). Access to this information is available through EPA's website (www.epa.gov). Conformance of the network to Appendix D (Network Design Criteria) and Appendix E (Probe and Path Siting Criteria) is determined using an Annual Review of the air quality surveillance system which states are required to provide for in 40 CFR 58.10. The location for this ruling is available in Docket ID No. EPA-HQ-OAR-2004-0018 in the <http://www.regulations.gov> index. The review is also used to ensure that the network is continuing to meet the objectives of the air monitoring program. The three basic objectives of the air monitoring program are follows:

1. Provide air pollution data to general public in a timely manner. Data can be presented to the public in a number of attractive ways including through air quality maps, newspapers, internet sites, and as a part of weather forecasts and public advisories.
2. Support compliance with ambient air quality standards and emissions strategy development. Data from the monitors for National Ambient Air Quality Standards (NAAQS) pollutants will be used for comparing an area's air pollution levels against the NAAQS. Data of various types can be used in the development of attainment and maintenance plans. Data can also be used to track trends in air pollution abatement control measures impact on improving air quality. In monitoring locations near major air pollution sources, source-oriented monitoring data can provide insight into how well industrial sources are controlling their pollutant emissions.
3. Support for air pollution research studies such as health effects assessments.

This review has several goals:

- Determine how (if) the network should be modified to continue to meet its monitoring objective and data needs (through termination of existing stations, relocation of stations, or establishment of new stations); and
- Investigate ways to improve the network to ensure that it provides adequate, representative, and useful air quality data.

Future Plans

Under EPA's proposed NCore design guidelines, the state of Louisiana is required to operate one NCore level 2 site, which will be the Capitol site. The remaining sites in the state will all be PAMS, SLAMS, STN, or SPMs.

The PAMS network plan exceeds the minimum monitoring requirements and can be found in Table C.

Regarding the upcoming PM_{coarse} standard, the LDEQ will continue to work with the EPA as they finalize the requirements of the new standard. As of March 2008, the National Ambient Air Quality Standard (NAAQS) for PM_{coarse} has not been proposed.

Nine sites (LSU, Carville, Port Allen, Meraux, Southern, Chalmette High School, Chalmette Vista, Lake Charles Lighthouse, and Kenner) have been chosen to have triggered Gas Chromatograph analyzers (GCs) installed to replace their current canister system. The GCs will operate on a trigger system whereby a 25-minute sample is pulled and analyzed whenever the hydrocarbon concentration is above a set limit. The concentration used to trip the sample mechanism will differ at each site to enable the system to sample approximately 20 times per month. This will be implemented in August 2008 and will end in July 2009.

In the event of projected budget cuts for fiscal year 2009/2010, LDEQ and EPA will work closely to minimize the impact of the cuts and to ensure continued public health.

We are considering discontinuing the Hydrogen Sulfide and Sulfur Dioxide monitors at the Chalmette High and Algiers sites in St. Bernard Parish. These were special purpose monitors originally scheduled to run from May 2006 - May 2007. These monitors all show low concentrations, with the highest at 1/3 of the NAAQS.

We have also proposed to discontinue some PM_{2.5} sites which are below 85% of the NAAQS. These sites are additional to the minimum required by the regulations. We will continue to operate these sites as long as our budget allows. We will continue to operate the same number of VOC, PM₁₀, Ozone, Oxides of Nitrogen, and CO sites.

Table A.

MSA/CSA Population ¹	MSA/DEQ Region	Number of Monitors Required Prior to Rule Change	Number of Monitors Currently Required as of 12/18/2006	Number of Existing Monitors	Proposed Network
1,000,000-4,000,000	<i>New Orleans / Southeast Region</i>				
	Ozone	6	2	6	6
	Nitrogen Oxide	1	0	1	1
